

How It Works (HTML Guide)

Once the script is loaded, it automatically styles standard HTML elements. You don't need to learn a massive library of utility classes.

Here is how to structure your HTML to get the best results:

1. Buttons (Extruded)

Standard `<button>` tags automatically get the 0G Purple text and a "flat" Neumorphic shadow. When clicked (`:active`), they press into the background.

HTML

```
<button>Connect Wallet</button>
```

2. Inputs & Textareas (Pressed)

Text inputs automatically look like indented wells, perfect for the Neumorphic aesthetic. They feature a subtle `#9200E1` border when focused.

HTML

```
<input type="text" placeholder="Enter 0G address..." />
```

3. Layout Cards

Need a container for your dApp interface? Wrap it in the `.zg-card` class for a beautiful, elevated Neumorphic surface.

HTML

```
<div class="zg-card">
  <h2>Dashboard</h2>
  <p>Your AI inference stats here.</p>
</div>
```

4. Code Blocks

Any text inside `<code>` or `<pre>` tags will automatically use the **Geist Mono** typeface for a clean, technical look.

HTML

```
<code>0x1234...abcd</code>
```

5. Auto Logo Swapping

To display the 0G logo, add an image tag with the class `0g-logo`. The toolkit will automatically inject the correct Light or Dark logo based on the user's current theme!

HTML

```
<img class="0g-logo" alt="0G Network Logo" />
```

Under the Hood (CSS Variables)

If you need to build custom components, the toolkit exposes CSS variables on the `:root` that you can hook into:

- `--bg-color`: The base background color matching the canvas.
- `--text-primary`: High-contrast text color.
- `--0g-purple`: The primary brand accent (`#9200E1`).
- `--shadow-flat`: The standard extruded Neumorphic shadow.
- `--shadow-pressed`: The indented Neumorphic shadow.

Example usage in your own CSS:

CSS

```
.my-custom-element {  
  background: var(--bg-color);  
  box-shadow: var(--shadow-flat);  
  color: var(--0g-purple);  
}
```
